

PUPPIES

CORE & ELECTIVE VACCINES

WHICH ONES AND WHEN?

DA2PP / DHPP = **d**istemper, **a**denovirus (hepatitis), **p**arvovirus, **p**arainfluenza. Recommended for all puppies.

Booster **every 3-4 weeks until minimum 16 weeks of age** (typically at **8, 12, & 16 weeks**), then repeat one year later.

Legally required. Rabies is a deadly disease!

Given once at either the **12 or 16 week visit**, repeated one year later, and then every three years thereafter.

Bacterial infection spread by **wildlife urine** (rats, skunks, raccoons, etc.). Affects the liver and kidneys, can also infect humans. **Condo-dwelling dogs and hunting dogs alike can be at risk.** Previously considered elective, but is now considered a core vaccine as of 2024. Two boosters given 3-4 weeks apart (typically at **12 & 16 weeks**), then once annually.

Causes kennel cough, a highly contagious **respiratory infection**. If infected, healthy dogs usually recover within 2 weeks; immune compromised dogs may develop complications like pneumonia. **Optional** vaccine, based on lifestyle and risk factors. One booster given at **any time**.
